Deploy the spring boot app in Amazon EC2 instance write up

- First create your spring boot application then create a jar file of your spring boot application [follow steps of section A].
- Then create EC2 instance in amazon console for that follow the steps of section B.
- Then open mobaxterm and connect to ec2 console using ssh command. Then follow the steps of SECTION C.

SECTION A

Steps to get the jar file of spring boot app

1. After writing the spring boot code, first run the app in local host
2. Then click on app and run as > maven clean
3. Then click on app and run as > maven build > in goals give "clean install" > apply > run
4. Then click on app and run as > maven install
   Then goto amazon ec2 instance.

SECTION B

Steps to create a EC2 instance

1. Goto ec2 dashboard > launch instance > give the instance name.
2. Then select the ubuntu 22.04 version
3. Select instance type t2.micro
4. Then select create new key pair give the keypair name and download key pair
5. Select create security group.
6. Then launch instance
7. After instance is launched goto security tab and click on the security group and then edit inbound rules
    - Then add rule custom tcp: 8080(port): anywhere ip then add rule.

SECTION C

Steps to run the app in ec2 console.

1. Open MobaXterm > goto local terminal
2. Then cd to the folder where you have added your springboot jar file and .pem file of the amazon ec2 instance.
3. Give the ssh command to connect to the ec2 instance i.e. ssh -i "myapp.pem" ubuntu@ec2-18-212-175-111.compute-1.amazonaws.com
4. Then you will be connected to ubunto ec2 instance give $: “sudo apt update” → to update the ec2 instance.
5. Then give “sudo apt-get install openjdk-8-jdk” → to install java in ec2 instance.
6. Then give “sudo apt-get install maven” → to install maven
7. Then copy the .jar file into the ubuntu home path then give “java -jar <jar file name>” It will start running the app in the in aws ec2 instance.
